

CrossAlps - LTF/EN C

High performance and powerful extras for XC paragliding

We at SKYMAN have put all our heart and soul into the development of CrossAlps. Markus Gründhammer and Toma Coconeá both contributed significantly to its design and realisation. This can be seen in quite some inventive details as well as in its quality and performance.

CrossAlps has special line loops, that reduce the air drag and special flares to evenly distribute load on the canopy. Precise stability tapes evenly distribute tension, thus grant high gliding performance and stability. CrossAlps can optionally be equipped with very light, aerodynamic Dyneema risers.

XC pilots who go paragliding in rough terrain, will not want to fly without these extras anymore.
